

Assignment 6A

Christian Broms

3/4/20

Low & High Fidelity Prototypes

I wanted to integrate the cart onto the current page the user is on. For this reason, the cart is not a separate page, but rather a panel that appears on the right side of the screen. When a user adds something to the cart, the panel automatically opens, revealing the contents of the cart, ensuring the current state is always clear. Additionally, it means that customers don't have to go to a different page to check their cart, meaning they're more likely to keep shopping before checking out.

I integrated this cart into the design by creating a slightly darker shaded side panel that looks visually distinct from the rest of the page. It's important that the cart be as simple as possible (no pictures) because it could be opened anywhere on the site, even if there are pictures behind it. This eliminates clutter and keeps the design as simple and aesthetic as possible.
